CASE STUDY

Driving Search Traffic

Optimizing Google's Search Levers to Shape Up Campaign Performance

adtaxi

An L.A. Liposuction Center wanted to grow business substantially and expand to new markets. They needed to drive more qualified leads at an efficient cost to increase the clinic's revenue and profitability.

Site traffic was very low across all channels. Our goal was to prove out a scalable model that could be replicated in another market to quickly attract new business to support an additional location.

The paid search campaign resulted in **312% increased site traffic** year over year and a 408% increase in form fills from all sources. Cost per lead decreased 23% and cost per click by 34% due to optimizations made based on campaign performance and added budget.

Due to the campaign success, our client increased staff, which in-turn allowed them to increase the budget as they could handle the increase in business. The success also provided the confidence to expand into a new market by simply replicating the campaign structure for a different geography.

CHALLENGES

Driving more qualified leads at an efficient cost

A scalable model that could be replicated

Substantially growing business and expanding to new markets

SOLUTIONS

Campaign ad groups based on user search behavior

Advanced call bid adjustments for increased opportunity

Responsive text ads with top performing content

RESULTS

312%
increase in site traffic

408%
increase in form fills

34%
reduction in cost per click

Seasonal Trends

With nearly two years of data, we were able to isolate seasonal trends and top performing devices and audiences to tailor the strategy and achieve optimal performance year round across geos.

Budget increases have been utilized during peak months to optimize performance and then reduced during lower traffic times to minimize inefficiencies.

Devices

Desktop traffic outperformed mobile traffic. This is likely due to liposuction being an expensive procedure that requires extensive research prior to making a decision.

Although desktop traffic is only 15% of the overall traffic, the cost per lead is 29% lower on desktop than on mobile.

When limited by budget, we decreased our mobile bids in an effort to capitalize on as much desktop traffic as possible. We also implemented advanced call bid adjustments to push phone call conversions on mobile.

Demographics

The male audience is only 18% of the total audience, however the cost per lead is 23% lower than the female audience.

Similarly, only 6% of our total audience is in the 65+ age range, but the cost per lead is 166% lower than our overall cost per lead.

This data was discovered when considering reducing bids on or eliminating the lower performing audiences from our targeting. However, we decided against this change when isolating that audiences less expected to utilize these services, in terms of societal norms, are converting at an efficient rate.

The Solution

After researching search volume trends, it was determined that general terms were more prevalent than those for the client's specialty procedures. Campaign ad groups were created based on user search behavior including generic terms, benefits and special price offerings.

Once the campaign was refined, it was expanded to include additional zip codes while still broken out in separate campaigns to control budget and optimizations.

Key Insights

Our strategy included creating in-market audiences based on performance, advanced call bid adjustments for increased opportunity to drive calls, and responsive text ads with top performing headlines.

The campaign substantially increased site traffic and fueled expansion into a new market.
