Video Case Study - Loyalty Rewards App

Loyalty rewards app company tapped Adtaxi to determine the effectiveness of Connected TV on driving new app installs.

adtaxi

Campaign Goals:

Optimize and track CTV performance to significantly reduce the eCPA for CTV installs.

Use mobile display retargeting to reach users who had recently watched 50% or more of the CTV spots without yet installing.

Challenge:

The eight-day campaign flight presented a challenge in itself. A longer flight provides more time to learn from ongoing results and add incremental optimizations in order to further maximize impact.

Nevertheless, by analyzing post-campaign data Adtaxi was able to draw conclusions from this short campaign that will be valuable for refining the client's future CTV efforts. Specifically, Adtaxi provided recommendations for several future CTV optimizations, including strategies for day-part, data element, geographic and inventory performance.

Campaign Strategy:

A loyalty rewards app company tapped Adtaxi in August 2020 to help determine the effectiveness of utilizing Connected TV (CTV) to help drive new app installs. It was decided that Adtaxi would run an eight-day trial campaign across CTV, Display and Pre-Roll, collecting detailed data to understand relative performance.

The client was committed to getting an accurate picture of CTV's potential performance not only for direct response but also in regards to existing user engagement lift: A budget of $22,160 was deployed specifically for CTV over the course of eight days, with an additional $2,766 each allocated to Display and Pre-Roll.

AppsFlyer, an analytics provider that is integrated with Adtaxi's platform, was leveraged to track CTV-driven app installs throughout the campaign. Adtaxi also helped refine targeting by building predictive models for IOS and Android based on a list of current users provided by the client.

With this strategy Adtaxi was able to prove resoundingly the value of CTV, reducing the cumulative effective cost per acquisition (eCPA) for CTV by 45.3% from Day 1 to Day 8. This was followed by a significant amount of trailing install conversions post-flight, with an additional 72.8% decrease by Day 20 after the campaign.

Results:

During the eight-day campaign, Adtaxi effectively optimized CTV media performance resulting in a daily decrease in the cumulative eCPA for app installs. The campaign data not only proved the immediate power of video, but also its trailing impact.

CTV earned 1,442 tracked installs, 1,160 tracked signups, and 992 tracked scan successes. In total, eCPA for CTV dropped 45.3% from Day 1 to Day 8. This was followed by a significant amount of trailing install conversions post-flight, with the cumulative net eCPA dropping an additional 72.8% by the 20th day.

Pre-Roll and Display saw similar trends. For Pre-Roll, eCPA dropped over 78% from Day 1 to Day 20. Likewise, between Days 1 and 20 Display eCPA dropped over 61%.

1,442
Installs tracked from CTV

1,160
Signups tracked from CTV

992
Scan successes tracked from CTV

45.3%
Reduction in eCPA for CTV from Day 1 to Day 8

72.8%
Reduction in eCPA for CTV post-flight

78%
Reduction in eCPA for pre-roll from Day 1 to Day 20

61%
Reduction in eCPA for display from Day 1 to Day 20

Key Insights

Adtaxi was also able to provide valuable breakdowns of CTV performance data, including the top performing day parts, data segments, geographic regions, and supply vendors.

Finally, the client's data science team was able to use Adtaxi's granular post-campaign reporting metrics by zip code to detect a significant lift on overall user engagement during the in-flight and immediate post-flight periods compared to the same time period pre-launch.
